

Cheltenham, 28 June 1876. And therefore did I
not get yours till this morning, but will telegr. to W. Wask
him to telegr. back you, shortest focus he undertakes. The
shortest I have heard of was (if I am correct) 15 in. to less than
Cpt. - He is now fully up to 24 in. of first quality. - My
9.38 in. splits & Mrs. Maj: thus  I believe they are
about 1" central distance. - black division = ± 0.75 of disc of
B. - I have had a most curious little photographed substitute for
pos: microm: sent from NZeal. - well worth trying - may turn out
very useful for ordinary purposes. Thought I got a much changed
angle out of one of Σ 's stars in Cyg: but must try again, & with
the little apparatus if I can. - with driving motion I believe 10
pos.ⁿ easily measured
